## Session #16

### Real Zeroes of Polynomial Functions

$$f(x) = x^3 - 4x^2 - 15x + 18$$

This isn't one of the "nice" 3<sup>rd</sup> degree polynomials:

a) Sum of two cubes:  $y = x^3 + 27$

b) Difference of two cubes:  $y = 8x^3 - 125$

c) 3<sup>rd</sup> degree with no "constant" term.

$$y = x^3 - 4x^2 - 12x$$

d) "nice" pattern that can be factored by grouping (or box):

$$y = x^3 + 3x^2 + 3x + 1$$

We are left with "guessing" the first degree polynomial that divides it evenly!

What are the zeroes?  $0 = (2x - 5)(3x + 7) \quad x = \frac{5}{2}, \frac{-7}{3}$

Multiply the two binomials (convert to standard form)

$$0 = 6x^2 - x - 35$$

What do you notice about the first and last terms and the zeroes?

$$0 = \textcircled{6}x^2 - x \textcircled{-35}$$

$$\boxed{2(3) = 6} \quad x = \frac{\textcircled{5} \quad \textcircled{-7}}{\textcircled{2} \quad \textcircled{3}} \quad \boxed{5(-7) = -35}$$

What are the zeroes?  $0 = (x - 3)(2x + 1)(x - 4)$

$$x = 3, \quad \frac{-1}{2}, \quad 4$$

Multiply the three binomials (convert to standard form)

$$0 = 2x^3 - 13x^2 + 17x + 12$$

What do you notice about the first and last terms and the zeroes?

$$0 = \textcircled{2}x^3 - 13x^2 + 17x + \textcircled{12}$$

$$x = 3, \quad \frac{-1}{2}, \quad 4$$

$$\begin{array}{l} \textcircled{\pm} \\ \hline 1, 2, \textcircled{3}, 4, 6, 12 \\ \hline \textcircled{1}, 2 \end{array}$$

$$\begin{array}{l} \textcircled{\pm} \\ \hline \textcircled{1}, 2, 3, 4, 6, 12 \\ \hline 1, \textcircled{2} \end{array}$$

$$\begin{array}{l} \textcircled{\pm} \\ \hline 1, 2, 3, \textcircled{4}, 6, 12 \\ \hline \textcircled{1}, 2 \end{array}$$

The Rational Zeroes Theorem: the possible rational zeroes of a polynomial are factors of the constant divided by factors of the lead coefficient.  $0 = 6x^2 - x - 35$

$$x = \pm \frac{1, 5, 7, 35}{1, 2, 3, 6} \quad x = \frac{5}{2}, \frac{-7}{3}$$

$$x = \pm 1, 5, 7, 35, \frac{1}{2}, \frac{1}{3}, \frac{1}{6}, \frac{5}{2}, \frac{7}{2}, \frac{7}{3}, \dots, \frac{35}{3}, \frac{35}{6}$$

What are the “possible” rational zeroes of the following polynomial?

$$y = x^3 - 4x^2 - 15x + 18$$

$$x = \pm \frac{1, 2, 3, 6, 9, 18}{1} \quad x = \pm 1, \pm 2, \pm 3, \pm 6, \pm 9, \pm 18$$

If  $x = 1$  is a “zero”, what factor did  $x = 1$  come from?

$$(x - 1)$$

If  $(x - 1)$  is a factor, then the 3<sup>rd</sup> degree factors as:

$$y = (x - 1)(ax^2 + bx + c)$$

Does  $(x - 1)$  divide the polynomial evenly?

$$x^3 - 4x^2 - 15x + 18 = (x - 1)(ax^2 + bx + c)$$

Divide left/right sides by  $(x - 1)$

$$\frac{x^3 - 4x^2 - 15x + 18}{(x - 1)} = \frac{(x - 1)(ax^2 + bx + c)}{(x - 1)}$$

$$\frac{x^3 - 4x^2 - 15x + 18}{(x - 1)} = ax^2 + bx + c$$

Steps in finding the zeroes of a polynomial  
(particularly one that is not easily factored).

$$y = x^5 - 5x^4 + 12x^3 - 24x^2 + 32x - 16$$

1. Determine the possible rational zeroes.  $x = \pm \frac{1, 2, 4, 8, 16}{1}$

2. Check each possible zero until the you find the first one that results in a remainder of zero.

$$\begin{array}{r} 1 \overline{) 1 \quad -5 \quad 12 \quad -24 \quad 32 \quad -16} \\ \underline{\phantom{1} 1 \quad -4 \quad 8 \quad -16 \quad 16} \\ 1 \quad -4 \quad 8 \quad -16 \quad 16 \quad \boxed{0} \end{array}$$

$$y = (x - 1)(x^4 - 4x^3 + 8x^2 - 16x + 16)$$

3. Same possible zeroes

$$x = \pm \frac{1, 2, 4, 8, 16}{1}$$

4. Find the next zero.

$$\begin{array}{r} 1 \overline{) 1 \quad -5 \quad 12 \quad -24 \quad 32 \quad -16} \\ \underline{\phantom{1} \phantom{-5} \phantom{12} \phantom{-24} \phantom{32} \phantom{-16}} \\ \phantom{1} 1 \quad -4 \quad 8 \quad -16 \quad 16 \\ \underline{\phantom{1} \phantom{1} \phantom{-4} \phantom{8} \phantom{-16} \phantom{16}} \\ \phantom{1} 1 \quad -4 \quad 8 \quad -16 \quad 16 \quad 0 \end{array}$$

$$\begin{array}{r} 1 \overline{) 1 \quad -4 \quad 8 \quad -16 \quad 16} \\ \underline{\phantom{1} \phantom{-4} \phantom{8} \phantom{-16} \phantom{16}} \\ \phantom{1} 1 \quad -3 \quad 5 \quad -11 \\ \underline{\phantom{1} \phantom{1} \phantom{-3} \phantom{5} \phantom{-11}} \\ \phantom{1} 1 \quad -3 \quad 5 \quad -11 \quad 5 \end{array}$$

'1' is not a repeat zero  $\rightarrow x = 1$  (multiplicity 1)

$$y = (x - 1)(x^4 - 4x^3 + 8x^2 - 16x + 16)$$

'1' is not a repeat zero  $\rightarrow x = 1$  (multiplicity 1)

5. Same possible zeroes  $x = \pm \frac{1, 2, 4, 8, 16}{1}$

6. Find the next zero.

$$\begin{array}{r} 1 \overline{) 1 \quad -5 \quad 12 \quad -24 \quad 32 \quad -16} \\ \underline{\phantom{1} 1 \quad -5 \quad 12 \quad -24 \quad 32 \quad -16} \\ \phantom{1} 1 \quad -4 \quad 8 \quad -16 \quad 16 \\ \underline{\phantom{1} 1 \quad -4 \quad 8 \quad -16 \quad 16} \\ \phantom{1} 0 \end{array}$$

$$\begin{array}{r} 2 \overline{) 1 \quad -4 \quad 8 \quad -16 \quad 16} \\ \underline{\phantom{2} 2 \quad -8 \quad 16 \quad -32} \\ \phantom{2} 1 \quad -2 \quad 4 \quad -8 \quad 0 \end{array}$$

$$y = (x - 1)(x - 2)(x^3 - 2x^2 + 4x - 8)$$

$$y = (x - 1)(x - 2)(x^3 - 2x^2 + 4x - 8)$$

7. Try “box factoring” of the 3<sup>rd</sup> – degree polynomial factor or continue trying synthetic division.

	$x$	$-2$
$x^2$	$x^3$	$-2x^2$
$4$	$4x$	$-8$

$$y = (x - 1)(x - 2)(x^2 + 4)(x - 2)$$

8. List the zeroes.

$$x = 1, 2i, -2i, 2 \text{ (multiplicity 2)}$$

Descarte's Rule of Signs: The number of positive zeroes is the number of sign changes in between the coefficients of  $f(x)$  or is an even integer less than the number of sign changes.

$$f(x) = x^5 - 5x^4 + 12x^3 + 24x^2 - 32x + 16$$

1 sign change    1 sign change    1 sign change    1 sign change

→ 4 sign changes

→ The number of positive zeroes is: 4 or 2

Descarte's Rule of Signs: The number of negative zeroes is the number of sign changes of between the coefficients of  $f(-x)$  or is an even integer less than the number of sign changes.

$$f(x) = x^5 - 5x^4 + 12x^3 + 24x^2 + 32x - 16$$

$$f(-x) = (-x)^5 - 5(-x)^4 + 12(-x)^3 + 24(-x)^2 + 32(-x) - 16$$

$$f(-x) = -x^5 - 5x^4 - 12x^3 + 24x^2 - 32x - 16$$

1 sign  
change

1 sign  
change

→ 2 sign changes

→ The number of negative zeroes is : 2 or 0
